

Problem Statement

A company works with number of employees; all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign this month or next. If they know previously, they can arrange alternative to avoid such problem.

As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

Requirement – Predict which are all the employees likely to resign

Criteria: There are different set of criteria where an employee might resign

1. Performance Rating
2. Employee low salary
3. Overtime
4. Employee work satisfaction
5. Employee Behaviour
6. Promotion History

Based on the above criteria, we can train a model we can predict which employee might resign next and perform call-to-action to notify the employer to arrange alternate solution

B) Find out the 3 -Stage of Problem Identification

Domain - ML

Learning – Supervised

Type - Classification

C) Name the project – Employee Resignment Prediction

D) Create the dummy Dataset

Emp_ID	Age	Gender	Department	Job_Role	Salary	Years_At_Company	Overtime	Promotion_Last_5Years	Job_Satisfaction (1-5)	Performance_Rating (1-10)	Work_Life_Balance (1-5)	Resignation (Y/N)
1001	25	Male	Sales	Executive	30000	2	Yes	No	2	7	2	Y
1002	40	Female	HR	Manager	75000	10	No	Yes	4	8	4	N
1003	29	Male	IT	Developer	50000	4	Yes	No	3	6	3	Y
1004	35	Female	Finance	Analyst	65000	7	No	Yes	5	9	5	N
